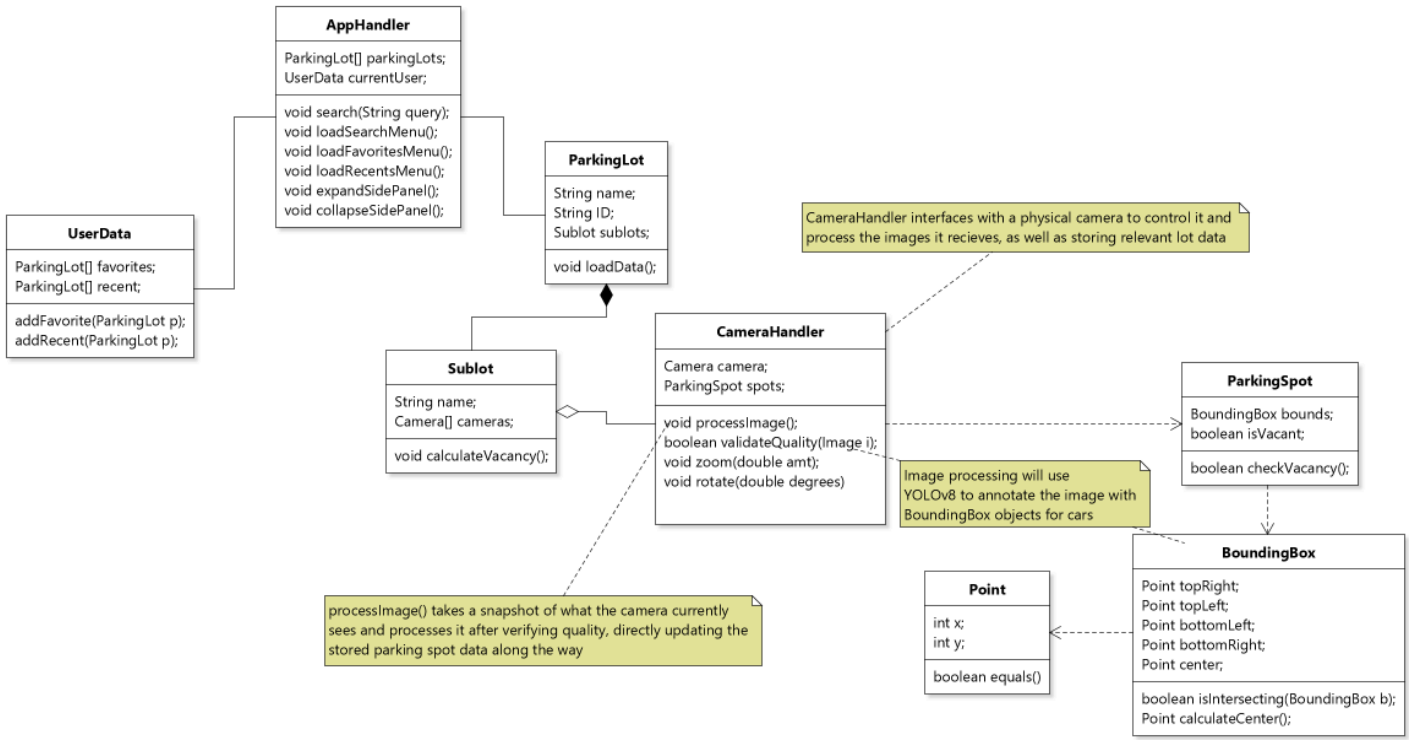
PARKING Design Documentation:

Database Schema:

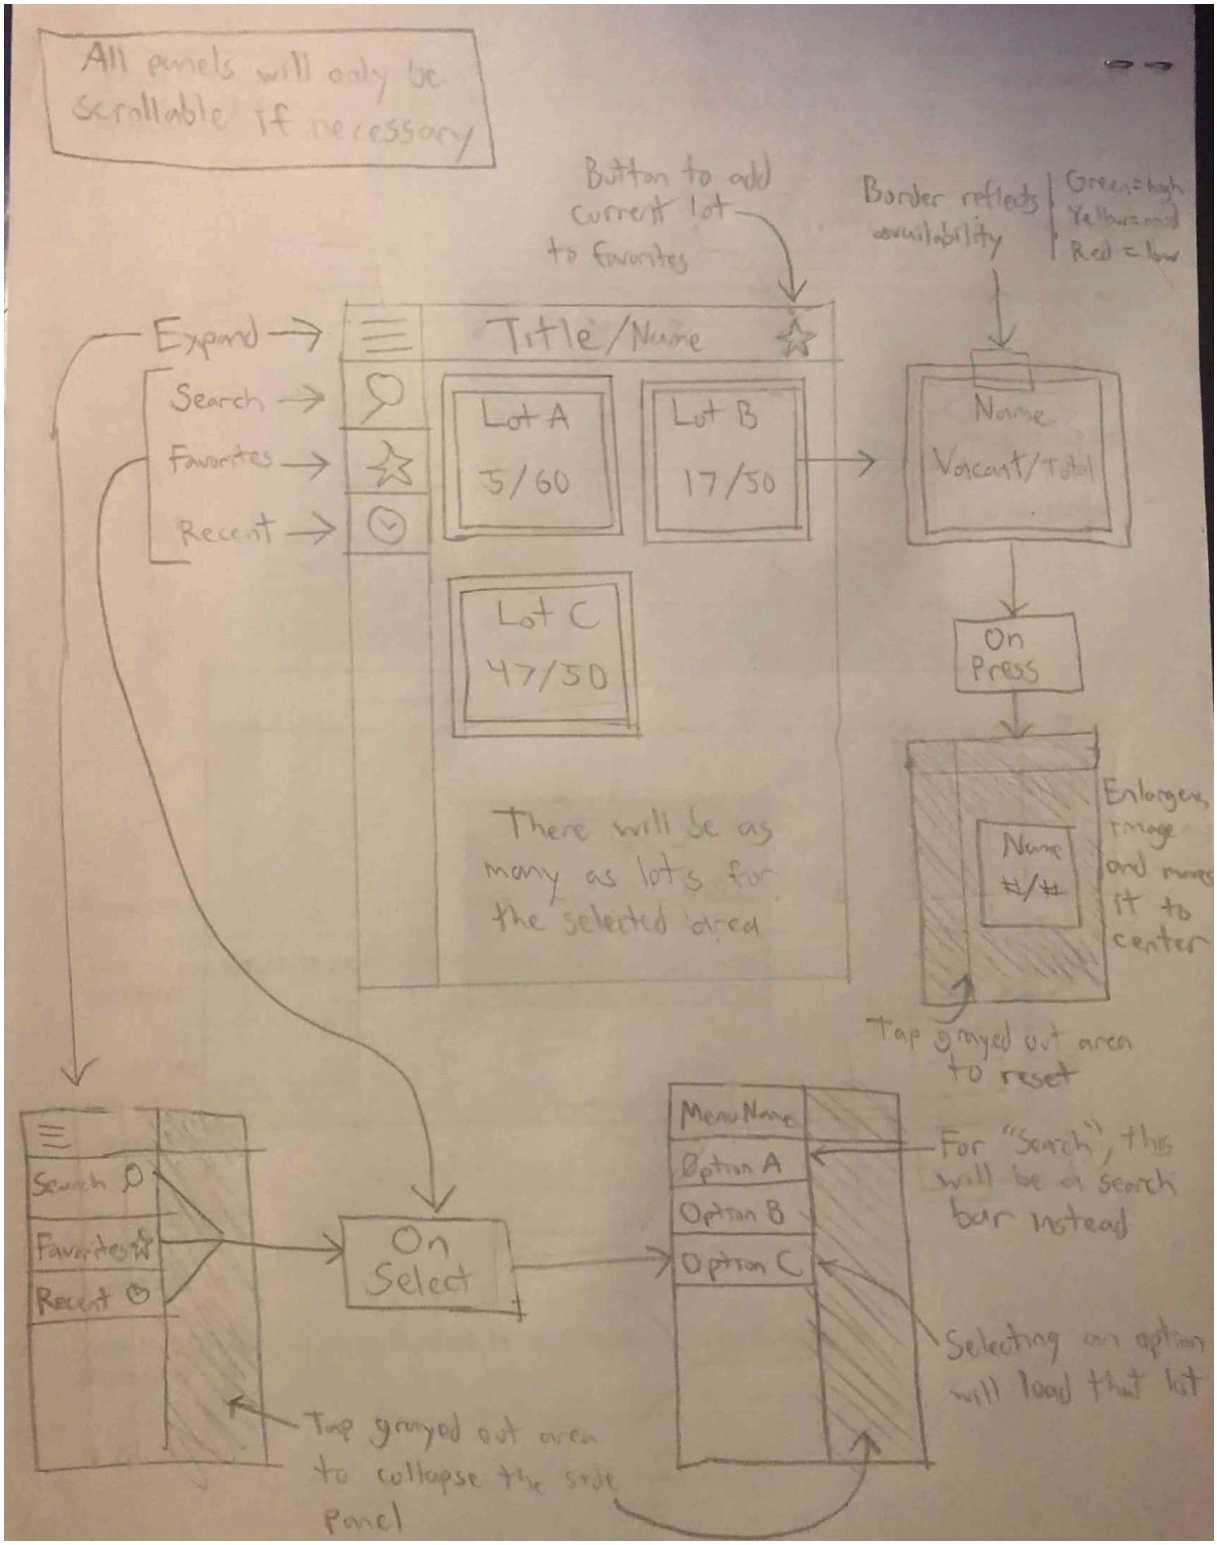


User Interface Design:
The user interface consists of a main panel and a side panel. The main panel displays the data loaded from the currently selected lot, while the side panel serves as the way to find and select different parking lots. The side panel will be expanded whenever one of its buttons is clicked, and must be collapsed to interact with the main panel again.

Here I will clarify on the function of the side panel buttons, as the diagram doesn't quite make that clear:

Expand simply expands the side panel and provides text to describe what each icon represents.

Search adds a search bar to the side panel. Upon interacting with the search bar, the user will be prompted to type in a search. Once the user concludes their search, the panel will be filled with matches from the database matching the query.

Favorites is a list of all parking lots favorited by the user. The side panel will be filled with all of these as options.


Recent will fill the side panel with a number of most recent lots selected by the user. Once the number exceeds a certain amount, say 6, for example, the oldest entry will be kicked out to make space for the newest one.
